Collin Stapleton, Emmett Colsch

Project Title: EzWeather

Description: EzWeather is a command line C application that users can use to view current weather descriptions in a location of their choosing. Users will be given temperature and precipitation data, with the option to include more data such as wind speed, humidity, etc. Users are also able to save their preferences in the system, and access previous weather data from the app.

2. Key Features and Functionalities

2.1 Location Management (10 pts)

Users can create, update, and delete locations in the system. These locations and their current weather conditions will be updated and output based on the current conditions in the user's selected area.

2.2 Conditions Management (10 pts)

Users can customize and update which additional weather conditions are displayed for their selected locations.

2.3 Wind speed (5 pts)

Collect the wind speed for the given location in miles per hour and convert to cardinal directions.

2.4 Local Storage (15 pts)

User locations and conditions are stored in text files within the system.

2.5 API for Weather Data (25 pts)

OpenWeather API to retrieve weather conditions for the given location, and output the user selected information when the user selects a given location.

2.6 Extreme Weather Warning (10 pts)

If there are any extreme weather warnings or watches the user will be notified immediately for their safety.

2.7 Pinned Mode (10 pts)

Users can keep the application open to continuously display the weather conditions, and rerun the application to update it.

2.8 Update Graphics based on Current Weather (15 pts)

Window pops up including the weather report, but updates graphics based on current weather (ex: a sun icon is displayed when it's sunny, or a raincloud for when it is raining).

Bonus Feature (5 pts)

Include information about which outdoor activities would be appropriate for a days weather conditions (e.g Sunny and warm weather outputs beach/pool day)

1. Project Overview
